*Allowable Subject Matter*

1. The following is an Examiner's Statement of Reasons for Allowance:

In interpreting the claims, in light of the specification and the applicant's arguments, the Examiner finds the claimed invention to be patentably distinct from the prior art of record.

Atozawa et al., Japanese Pat. No. JP5153121, teaches the invention substantially as claimed.

Atozawa teaches a system and method for network administration wherein a first managed node gathers management information from other managed nodes connected to one of its multiplicity of ports on a wired network.

However, the prior art of record fails to teach or suggest individually or in combination a system and method in a network system comprising a plurality of terminals interconnected via a network, selecting one of the plurality of terminals to obtain information from all other interconnected terminals on the network and forward that information to the controller. In contrast, the prior art teaches a system wherein a selected node retrieves information only from managed nodes directed connected thereto, but not all nodes in the network. In Atazawa, if it is found that information from a particular node is missing or not retrieved by the selected node (e.g. because the node is not directly connected to the selected node, i.e. node is indirectly connected), a new call is generated to those nodes to retrieve the administrative information from those nodes. See Atazawa, ¶ 0018.

The Examiner finds the applicant's arguments on page 8, lines 20-22 and page 10, lines 7-11 of the amendment filed January 17, 2007 to be persuasive. The applicant argued in substance that the prior art of record does not teach a system and method in a network system comprising a plurality of terminals interconnected via a network, selecting one of the plurality of

terminals to obtain information from all other interconnected terminals on the network and forward that information to the controller.

In order to clarify the record, the examiner notes that applicants' arguments regarding the prior art's failure to teach selecting a node to retrieve information from the other nodes. See Remarks, page 9, lines 1-10. Applicants incorrectly characterizes the prior art that certain nodes, for instance node 6g, is prewired to collect information on the other nodes. The examiner disagrees. While the certain nodes are wired to other nodes therefore capable of sharing information with one another, any node on the network may be selected to retrieve information from any other node wired to it. See Atazawa, ¶ 0018.

2. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
